

The Measure

The Installation

The Completed Job

THE FIT

## WALL CLADDING

The job pictured to the left is one of eight hospital operating rooms in this total project. Each room is being paneled with solid surface material. The remarkable part of this project is that each room has 30 or more electrical outlets and utility box openings that must be cutout of the sheets of material before being attached to the drywall. What is more remarkable is that each opening was pre-measured with ETemplate Photo™ and all openings were pre-cut with a CNC router prior to the panels being delivered to the jobsite for installation. No onsite cutting was required. The bottom two photos were taken after installation was completed. As you can see,

***THE FIT IS PERFECT!***

***Quoted at 57.5 hours per room***

Using ETemplate Photo™, from measuring to completed job

***took only 25.5 hours per room***

**A 56% SAVINGS!**
